Hackathon Use Case Charter

Use Case Charter – Fillable Template

Instructions: Complete all sections below. To lock the document after setup, use Developer → Restrict Editing → Allow only 'Filling in forms'.

1. Goals and Motivation

Challenge Name: **Implementation Risk Predictor**

Core System / Intelligence Layer Name:

Exec Sponsor: Vinit Doshi

Sponsor (Company / Business Unit):

SMEs: Julia Hunt (Implementations), Shelby Phillips (Customer Success) and Jake Finger (Finance)

BEST Sponsor: Chris Byrom

Domain:

Business Unit / Product Name: **Implementations, Customer Success and Finance**

Problem Statement

Describe the core problem:

After bookings are sold to customers implementations can be delayed, cancelled or never implemented at all. Score new customers at signing for likelihood of onboarding delay, cancellation or failure to implement. Create a dashboard that allows Sales, Customer Success, Finance and other departments to view monthly cohorts of bookings. This will allow departments to view bookings that may need more coverage and determine the revenue recognition risk of new bookings.

Key Pain Points:

• Implementations team must implement booking for PMC that does not have the resources

• Finance teams who use the bookings to forecast revenue must adjust the expected revenue due to leakage (customer never implements, not all sites are activated)

• Engagement Management/CS/CSM/Platinum Support resources do not know which PMC's to assist (lower likelihood of implementation might need more engagement from EM team). Allows higher operational forecast for the engagement management organization to deploy their limited resources against.

Hackathon Use Case Charter

• Conversions team don't have visibility into which customers are higher risk so that they can allocate additional time and engage earlier to ensure that scheduled conversion dates are met.

2. Hero Features – What You Could Build

Choose one direction and go deep.

Feature	Description
Bookings cohort dashboard (primary objective)	View of monthly bookings/ orders created and what the likelihood of implementation or delay is (bookings score). Ability to group by product, PMC, size, market
Resource allocation model	Determine what bookings will need additional resources due to historical factors driving implementation delays(CS, Engagement Managers, sales)
Machine Learning model	Using historical implementation data, determine what factors drive longer MTTI (Mean Time To Implement). MTTI is calculated as time between order created date and implementation date. Use this real time updated data to score what variables create greater implementation risk
Customer Health	Use variables and historical data trends to determine health of customer. Predict when the customer is in danger of becoming red.

3. Hints and Resources

Data Sources

Data	Description
Salesforce	Various fields from Salesforce will be utilized as potential data points. See #6 Dataset Appendix.

Hackathon Use Case Charter

EDW	Annual Realized Revenue, would need Finance Hierarchy

AI & Cloud Tools (Optional but Encouraged)

Tool	Purpose
OpenAI	Machine Learning for creating score

4. Evaluation Criteria

Criterion	What Success Looks Like
Learning Capability Approach	System improves bookings reliability and resource allocation over time by learning which variables may cause implementation risk
Compliance & Safety Approach	Bookings data is handled according to internal data governance policies. Sensitive data is not exposed unnecessarily.
Accuracy & Consistency Approach	Bookings score helps to determine likelihood of bookings to generate revenue for RealPage
Automation & Scalability Approach	The system automatically generates bookings analysis for all monthly bookings cohorts
Enterprise Readiness Considerations	Solution can be available to multiple departments without requiring heavy customization.

5. Why It Matters

Business Impact Summary:

All bookings do not currently realize into revenue recognition. Scoring bookings to determine implementation risk will allow Sales to sell higher quality bookings. MTTR will be optimized by allocating resources aligned with customer engagement, resulting in consistent prediction accuracy over time. Additionally, it will allow Finance to more accurately forecast revenue. Lastly, real time customer health and bookings scoring can help resource allocation (Customer Success or Implementation services can assign resources to customers that are trending negatively)

6. Dataset Appendix (If Applicable)

Sample Dataset file that pulls data points from PMC, CSR, Implementation Order, Opportunity, and DocuSign objects: Example for Delay Indicator Score.xlsx

Full report for data analysis on which data points impact MTTI: Delay Indicator Score. The "2025 Master orders" tab contains the full data set. The "Report List" tab contains the Salesforce reports used to pull the data and information on how the separate reports were joined.

Data Points	Salesforce Object	Notes
Implementation Type	Implementation Orders	Assumption: New logo will take longer to implement than add-on
Product Name	Implementation Orders	Look at historical data for product types, both overall and specifically for that PMC. Look at how many products are ordered at the same time, with the assumption that more products = longer implementation time.
Property ID	Implementation Orders	Look at how many sites have orders coming in at the same time. Assumption: More sites = longer implementation time
Total On Hold Days	Implementation Orders	Assumption: Higher number = longer time for future implementations at this PMC
Referred to Sales Days	Implementation Orders	Assumption: Higher number = longer time for future implementations at this PMC
Total Initial Outreach Days	Implementation Orders	Assumption: Higher number = longer time for future implementations at this PMC

Hackathon Use Case Charter

Total Order Request	Opportunity	Assumption: Higher = longer implementation time for this booking
Count of Revisions	Opportunity	Assumption: Higher = longer implementation time for this booking
DocuSign Hours to Complete	DocuSign	Assumption: Higher = longer implementation time for this booking
CSR Times Scheduled	Conversion Service Request (CSR)	Assumption: Higher number = longer time for future OneSite Leasing & Rents implementations at this PMC
CSR Scheduled Date to CSR Completed Date	Conversion Service Request (CSR)	Assumption: Higher number = longer time for future OneSite Leasing & Rents implementations at this PMC
CSR Consulting Involved	Conversion Service Request (CSR)	Yes = longer time for implementation at this PMC
OMS Total Site	PMC Account	Use as datapoints, assumption unknown.
OMS Total Units	PMC Account	Use as datapoints, assumption unknown.
Business Type	PMC Account	Use as datapoints, assumption unknown.
Territory	PMC Account	Use as datapoints, assumption unknown.
Property Mgmt Solution – Former	PMC Account	Use as datapoints, assumption unknown.
Solution Types (Contact Center, Online Leasing, Payments, etc.)	PMC Account	Use as datapoints, assumption unknown.
